What is Overmolding?

EverGrip™ premold

EverGrip™ connectors go through two separate molding processes to ensure that they are **exceptionally tough, remarkably safe, and maintenance free.**

The core of EverGrip™ is a polypropylene premold. It provides a mechanical bond between the cable and connector and environmental sealing of the terminations. Because the premold encapsulates the contact and wires, the possibility of pushed pins is eliminated and the ground ring cannot loosen.

The Santoprene™ overmold doesn't just look nice - it provides superior flex relief. The solid molded construction is impact resistant and covers all aspects of the connector - even the locking ring. This means total surface insulation when the devices are mated. These advantages can **double the flex life** of your assemblies.

We're so confident that we're offering a **5 year limited warranty*** - an unprecedented offer for multi-cable.
